**RESEARCH INTERESTS**

---

My fundamental research interests are the evolutionary and ecological mechanisms shaping the diversity and distributions of vascular plants with main focus on polyploid genera of *Hieracium* and *Pilosella*, both with prevalent asexual seed reproduction – apomixis, and *Centaurea*, which encompasses several important plant invader species. Since apomictic taxa are typically allopolyploids, my research focuses on polyploidization and interspecific hybridization and effects of these phenomena on evolution of apomixis in natural and artificial polyploids, and on consequences of apomictic reproduction and polyploidy on fitness, and taxonomic and distributional patterns.
