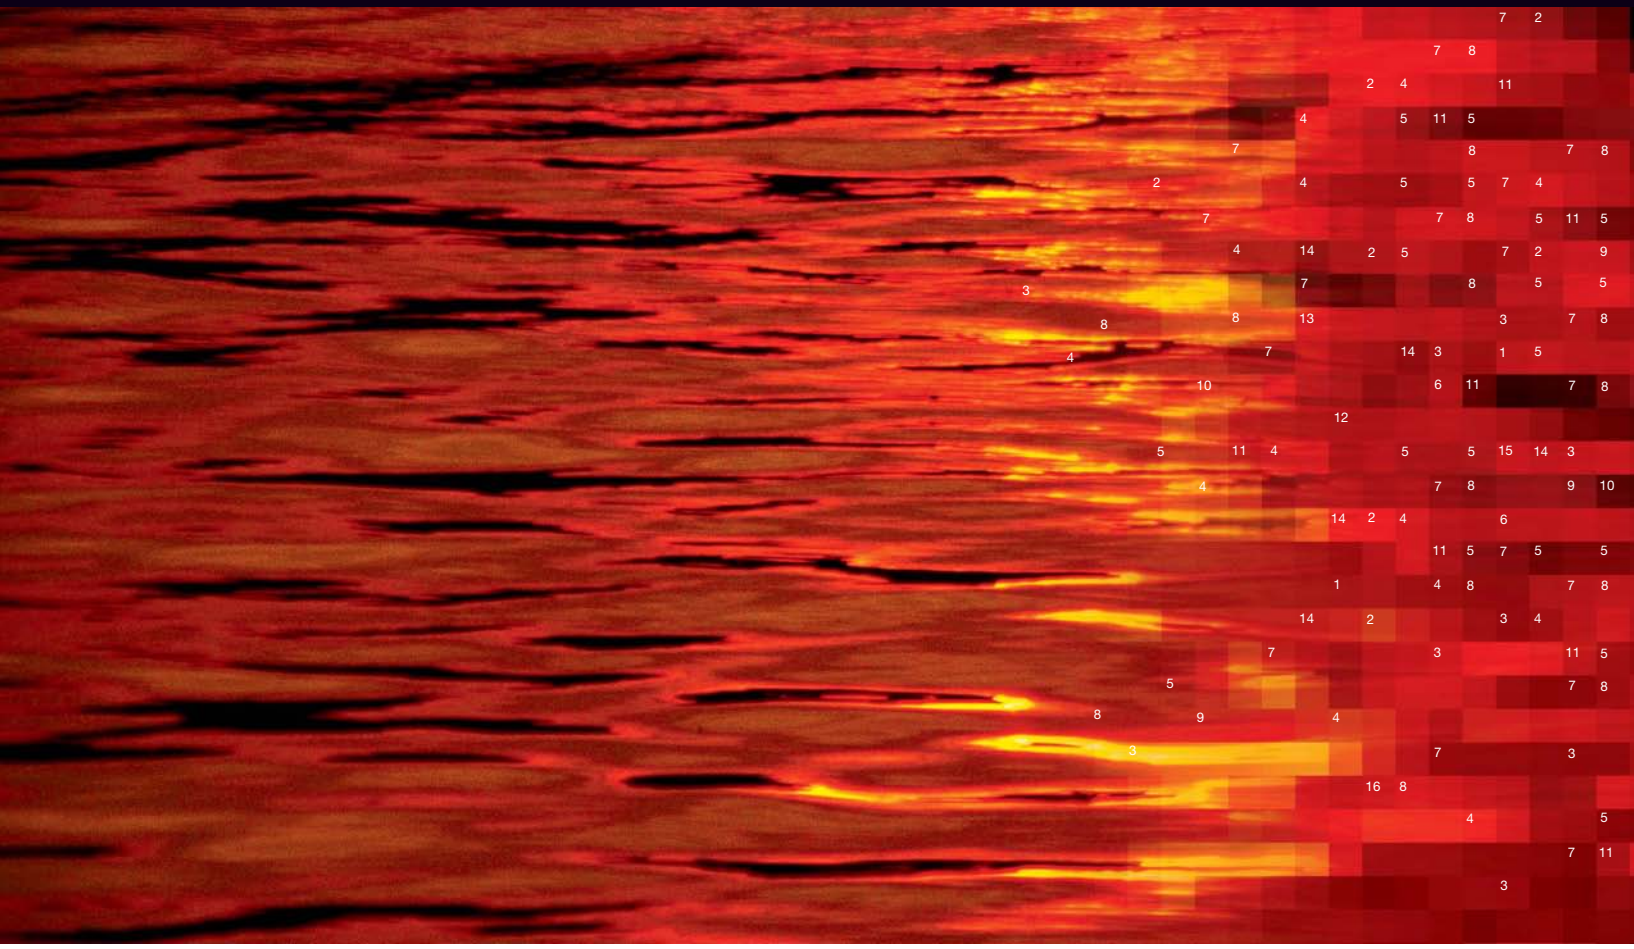
Molecular Imager® PharosFX™ Systems



Your Vision Ahead

BIO-RAD

Molecular Imager Systems

Bio-Rad's line of Molecular Imager systems offers a unique selection of specially designed solutions for imaging fluorescent, colorimetric, chemiluminescent, or radiolabeled samples.

While drawing on diverse technologies and performing in a variety of applications, Bio-Rad's Molecular Imager systems share a distinctive set of features: a common software interface, seamless integration with data analysis tools, intuitive instrument controls, compact ergonomic design, and superior data quality.

Molecular Imager PharosFX Systems

These powerful systems are carefully optimized for imaging complex fluorescence applications, and can be used for the sensitive detection and analysis of DNA, RNA, or protein samples in gels, blots, or microplates.

Molecular Imager PharosFX and PharosFX Plus Systems

The Molecular Imager PharosFX and PharosFX Plus systems are specially designed for imaging the most complex multifluorescence applications. Both systems:

- Image single- and multicolor fluorescence via direct laser excitation, with high sensitivity, high resolution, and precise spectral assignment
- Detect a wide range of fluorophores with optional 488 nm and 635 nm external lasers
- Utilize novel fluorophores when configured with custom emission filters
- Are equipped with a transillumination screen for gel documentation with colorimetric stains
- Integrate seamlessly with PDQuest™ 2-D analysis software and the EXQuest™ spot cutter

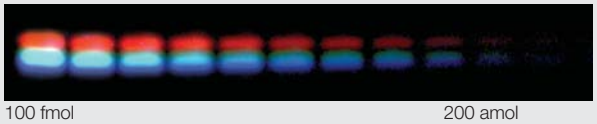
The Molecular Imager PharosFX Plus system combines the sophisticated fluorescence imaging capabilities of the PharosFX with the ability to image radiolabeled samples using storage phosphor screens, all in a convenient, ergonomically designed unit.

The PharosFX Plus system:

- Accurately quantitates ^{32}P, ^{33}P, ^{35}S, ^{14}C, and ^{3}H over a wide dynamic range (5 orders of magnitude vs. 3 for X-ray film)
- Accommodates most commercially available storage phosphor screens (20 x 25 cm and 35 x 43 cm)

Fluorescence Detection and Gel Documentation With the Molecular Imager PharosFX and PharosFX Plus Systems

The included Quantity One® software offers turnkey application templates for most common fluorophores and colorimetric dyes. The option of adding 488 nm and 635 nm external lasers to the built-in 532 nm laser ensures excellent application flexibility.



100 fmol 200 amol

Limits of detection and separation of fluorescent signal into three color channels. End-labeled oligonucleotides separated by a Criterion™ 15% TBE gel. Sizes are 20, 25, and 30 bases. Red is Cy5, blue is FAM, and green is Cy3. The FAM and Cy3 dyes comigrate in this gel, resulting in the cyan bands, visible down to 200 amol.

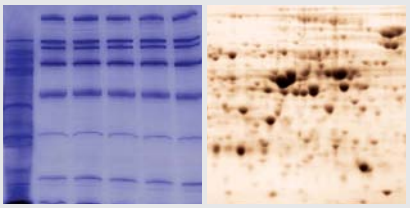
Traditional and Novel Fluorophore Detection

In both these models, optimized excitation/emission filter combinations deliver optimal signal-to-noise and thus exceptional sensitivity. Flexibility in the choice of filters, together with software control, allows extensive user customization. The PharosFX and PharosFX Plus imagers detect photons with a variable-gain photomultiplier tube (PMT) assembly. The variable PMT gain is software-controlled, and can be used to boost imaging sensitivity for enhanced detection of low-abundance proteins or small quantities of fluorescently labeled nucleotides.

While the PharosFX systems include several installed emission filters to cover a range of applications, they also offer the flexibility to install any filter type that is required for special applications. A filter holder is provided, and the bundled software can store information about custom applications, including the appropriate emission wavelength. PharosFX systems incorporate two fully automated emission filter wheels, with up to five positions that can be used for custom filters.

Colorimetric Detection

For gel documentation with colorimetric stains, a transillumination screen is included with the standard accessories of the PharosFX and PharosFX Plus systems.



Coomassie Blue R-250 Silver stain

* Bandpass filter = Filter cannot be changed.

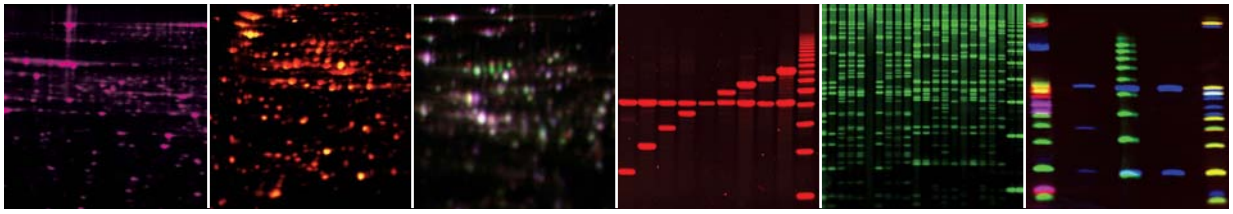
Filter holders with emission filters can be easily accessed from the front panel.

For a unique application, order required emission filter from an optical filter vendor. The PharosFX uses emission filters with standard microscopy filter parameters (diameter, thickness, optical coating).

1. Microscopy-type emission filter.
2. Filter holder.
3. Locking plastic cylinder.

Advanced Applications for Functional Genomics and Proteomics

Exceptional versatility is what makes the PharosFX and PharosFX Plus the most desirable fluorescence imagers. Their resolution, sensitivity, and scan speed have been specially designed for imaging the most complex 1-D or 2-D gels and blots, or even macroarrays.



Flamingo™ | SYPRO Ruby | DIGE | Ethidium bromide | SYBR Green I | FITC/Cy3/Cy5

Molecular Imager PharosFX Systems: The Best Choice for Proteomic Applications

The PharosFX and PharosFX Plus systems enable protein detection and expression analysis involving small quantities of low-abundance proteins or subtle changes in expression.

Stain gels with Flamingo fluorescent gel stain and then scan them with a PharosFX system for the most sensitive quantitative detection of total protein in gels.

The PharosFX and PharosFX Plus systems support a broad range of multiplex fluorescence imaging applications in gels and blots, such as Qdot multiplex blotting, DIGE, and gel staining with Pro-Q dyes.

Quickly and easily scan 2-D gels as part of any expression proteomics workflow — or pair the PharosFX or PharosFX Plus with the BioOdyssey™ Calligrapher™ miniarrayer for simple yet efficient protein array printing and scanning. In combination with the EXQuest spot cutter, the PharosFX systems support a compact, convenient, and user-friendly proteomic workflow.

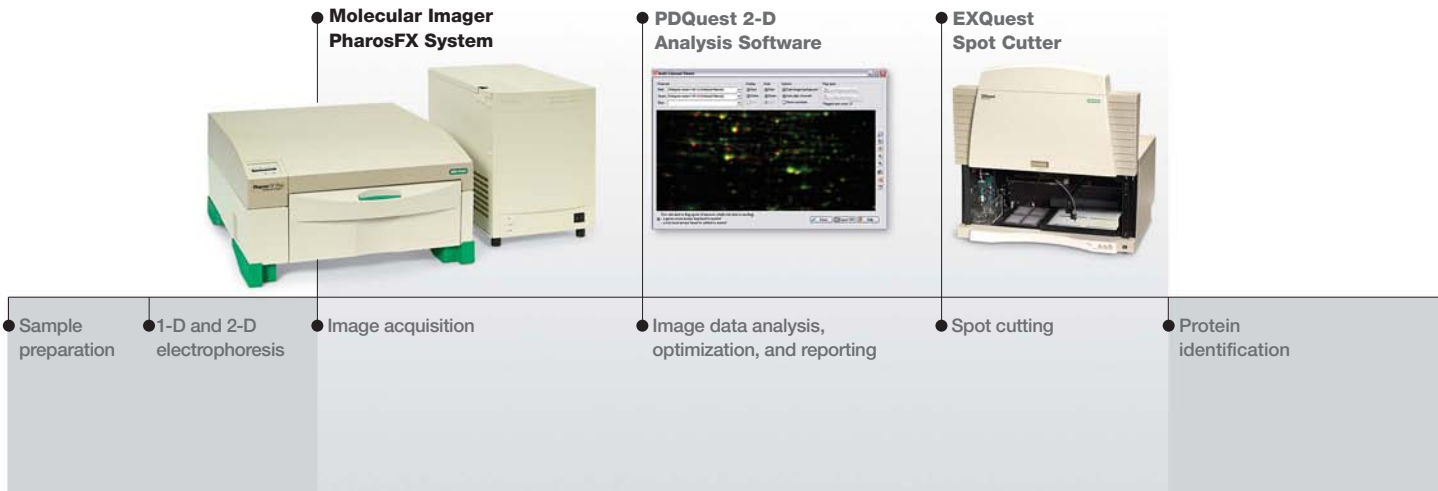
To learn more about the full range of expression proteomics products and applications offered by Bio-Rad, request bulletin 5331, or visit us on the Web at **www.expressionproteomics.com**

Molecular Imager PharosFX Systems: The Best Choice for Genomic Applications

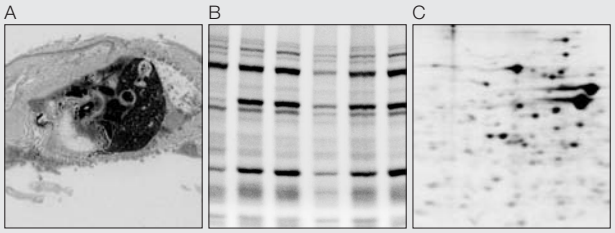
The PharosFX and PharosFX Plus systems are compatible with standard nucleic acid stains such as ethidium bromide, SYBR Green, and Radiant® Red. Their exceptional resolution and multiplexing capabilities enable accurate high-throughput quantitative scanning of fluorescent macroarrays for gene expression analysis. The PharosFX Plus also handles radiolabeled samples for the broadest range of genomic applications.

Accurate detection and efficient analysis for RNAi applications can be achieved with the wide range of Bio-Rad-supported protein or gene expression techniques (for more information, go to **www.bio-rad.com/RNAi/**). The PharosFX and PharosFX Plus systems are the imagers of choice to take advantage of the various technologies for qualitative and quantitative assessment of gene silencing.

Expression Proteomics Workflow



The PharosFX Plus is also designed to handle a variety of storage phosphor applications. Storage phosphor screens — which are sensitive to β-particles, γ-rays, and X-rays — are reusable, and with proper treatment are unharmed by repeated exposure to radioisotopes.



Radiolabeled samples. A, rat (^{14}C); B, DNA (^{32}P); and C, protein (^{35}S).

Sample exposure cassette

Screen eraser

Imaging Screen-K

These are general-purpose screens designed for use with commonly used radioisotopes such as ^{32}P, ^{33}P, ^{35}S, and ^{14}C. These screens are covered by a 1 year limited warranty.

Imaging Screen-K/Tritium

These are specialty screens, available for imaging ^{3}H. The screens require special handling and are reusable only with proper care. They are covered by a 6 month limited warranty.

Sample Exposure Cassette

The sample exposure cassette is designed to ensure that close contact is made between the sample and imaging screen. The cassette features a grid-marked surface where the sample is mounted, which allows it to be firmly pressed against the imaging screen to generate a high-quality image.

Screen Eraser

The screen eraser removes any residual signal or excessive background from an exposed storage phosphor screen. The erasure process blanks the screen to a minimal "zero" level, for maximum sensitivity, broad linear response, superior image quality, and quantitative accuracy. Complete erasure of the screen after each exposure extends its useful life.

Imaging Screen Specifications and Recommended Applications

Screen Name	Application	Key Features	Sizes (W x H)	Catalog #
Imaging screen-K	^{32}P, ^{33}P, ^{14}C, ^{35}S	BaFBr:Eu formulation Protective coating Easy-to-use format Compatible with standard X-ray cassettes	35 x 43 cm 20 x 25 cm	170-7841 170-7843
Imaging screen-K/tritium	^{3}H	BaFBr:Eu formulation Sensitive to weak ^{3}H signal Easy-to-use format Compatible with standard X-ray cassettes	20 x 25 cm	170-7845

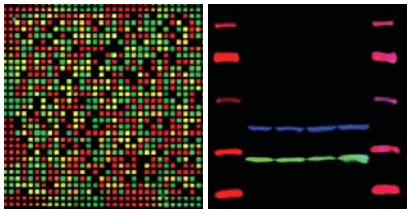
The Personal Molecular Imager™ (PMI™) System

This imager is another member of the Molecular Imager family that is designed specifically for detection of radiolabeled samples using storage phosphor screens. The PMI has all the storage phosphor detection capabilities and functionality of the top-of-the-line PharosFX Plus. For more information, visit us on the Web at **www.bio-rad.com/imaging/**

Scanning of a Wide Variety of Samples

The PharosFX, PharosFX Plus, and PMI systems are equipped with accessories that allow scanning a wide range of gels, blots, and microplates with high sensitivity and precision.

A B



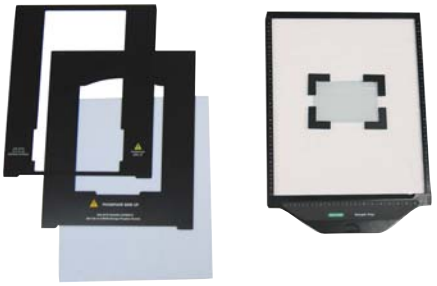
A, 1,536-well microplate labeled with FITC and rhodamine;
B, western blot with Qdot particles of 605, 655, and 705 nm.

Accommodates Various Blots and Gels

The glass sample tray that is included with each scanner is moisture-sealed and is ideal for scanning wet blots and gels.

The black aluminum multi-sample trays are designed to accommodate different types of phosphor screens, polyacrylamide gels (within the glass plates), and thick agarose gels. For microplates, a convenient adaptor is provided to position the plates securely during scanning.

A B



Sample tray (170-7811) comes with: A, a transillumination screen for gel documentation of colorimetric stains; B, four gel holders and two frames for positioning smaller storage phosphor screens. All of these components are included with each Molecular Imager PharosFX, PharosFX Plus, or PMI system.

Multi-sample tray I and multi-sample tray II.

Selection of Appropriate Accessories for Specific Applications

Accessory	Uses	Preparation Notes	Catalog #
Sample tray	Agarose gels; polyacrylamide gels; blots and membranes; colorimetric stains; unmounted storage; phosphor screens	■ No gels thicker than 8 mm ■ Gels should be wet ■ Blots or membranes should be moist ■ Use sample holders (170-7813) to keep sample from moving during scan ■ For imaging colorimetric stains, use the transillumination screen supplied ■ Will accept unmounted screens from many manufacturers, including Kodak, MD, and Fuji ■ For working with 20 x 25 cm small-format screens (170-7843), use the alignment template supplied with the sample tray	170-7811
Multi-sample tray I	Mounted screens (MD format); microplates	■ Face MD screens upward inside the tray ■ For scanning microplates, use the microplate adaptor (170-7814) ■ Microplate adaptor assembly accepts up to 8 microplates ■ Plates that can be scanned include 96-, 384-, and 1,536-well formats	170-7812
Multi-sample tray II	Polyacrylamide gels sandwiched between glass plates; polyacrylamide gels sitting on glass with no upper glass plate; TLC plates	■ Make certain that the thickness of the sample and the glass plates fits within the scanner prior to scanning ■ The multi-sample tray II ships with three sets of nonslip spacing strips; use these to determine the optimal focus for differential display work	170-7819

Molecular Imager PharosFX and PharosFX Plus Systems	
170-9450	Molecular Imager PharosFX System, PC or Mac, 100/240 V, includes Quantity One software, sample tray set, fluorescence filters (170-7866, 170-7896), USB2 cable, instructions
170-9460	Molecular Imager PharosFX Plus System, PC or Mac, 110/240 V, includes Quantity One software, sample tray set, fluorescence (170-7866, 170-7896) and phosphor imaging filters, USB2 cable, instructions
Personal Molecular Imager (PMI) System	
170-9400	Personal Molecular Imager (PMI) System, PC or Mac, 110/240 V, includes Quantity One software, sample tray, SCSI cable, instructions
Accessories	
170-7890	External Laser, 488 nm, includes 170-9459 filter
170-7893	635 nm External Laser Upgrade, for 170-7890, includes 170-7865 filter
170-7892	External Lasers, 488 nm and 635 nm, includes 170-7865 filter
170-9459	Filter 530 nm BP, for ECL Plus, AttoPhos, SYBR Green I, Alexa Fluor 488, FITC, Cy2, and Pro-Q Emerald dyes
170-7863	Filter 555 nm LP, for Texas Red dye
170-7866	Filter 605 nm BP, for ethidium bromide, SYPRO Red, SYPRO Ruby, Alexa Fluor 532 and 546, and Cy3 dyes
170-7896	Filter 640 nm BP, for Texas Red dye
170-7865	Filter 695 nm BP, for Cy5 and Alexa Fluor 635 dyes
170-7867	Blank Filter Holder
170-7811	Sample Tray
170-7813	Sample Holders, for gels
170-7812	Multi-Sample Tray I, for small aluminum-mounted screens and microplates
170-7814	Microplate Adaptor, for multi-sample tray I
170-7819	Multi-Sample Tray II, for scanning gels mounted to glass plates
170-7845	Imaging Screen-K (Kodak)/Tritium, 20 x 25 cm
170-7843	Imaging Screen-K (Kodak), 20 x 25 cm
170-7841	Imaging Screen-K (Kodak), 35 x 43 cm
170-7861	Exposure Cassette-K, for 20 x 25 cm Kodak screen
170-7862	Exposure Cassette-K, for 35 x 43 cm Kodak screen
170-7809	Screen-K Eraser, 110/120 V
170-7806	Screen-K Eraser, 220/240 V
931-0071	3 m USB Cable
161-0722	Bio-Rad Cleaning Concentrate
