dne 20.3. v 15:00 hod.

v posluchárně CH2, v budově chemických kateder PŘF UK
Hlavova 8, Praha 2

Abstrakt:

As part of our ongoing efforts aimed at the synthesis of aromatic belts (small slices of armchair single-walled carbon nanotubes), we have recently reported the synthesis of a series of 1,1, n , n -tetramethyl $[n](2,11)$ teropyrenophanes.^{1,2}

With an eye to gaining access to gram quantities of the 1,1, n , n -tetramethyl- $[n](2,11)$ teropyrenophanes, a heavily modified synthetic pathway has been

developed. To date, more than 3 g of 1,1,9,9-tetramethyl[9](2,11)teropyrenophane **1** has been synthesized and it has been found to undergo electrophilic aromatic bromination with high regioselectivity to afford tetrabromide **2**. This has enabled the synthesis of more elaborate systems **3** via Suzuki-Miyaura and Sonogashira cross-coupling reactions. Details of this work and preliminary efforts to synthesize much larger nonplanar aromatic systems will be presented.
