## Tracing Microendolithic Ichnocenoses: A paleoecological and taphonomic approach over the Phanerozoic

The thesis aimed to understand how microboring structures, preserved in foraminiferal tests and other bioclasts, can respond to relative paleobathymetry in the past.

Surveyed samples are from Early Paleozoic of Prague Basin, Cenozoic of several localities in the Western Carpathians, and Maastrichtian from the Boreal Sea.

The intrinsic connection of producers and their environments produced signatures of stressful events, threshold conditions and ecological shifts in the past.
